## 1 OVERVIEW

The RK808 is a complete power supply solution for Portable systems. The highly integrated device includes four buck DC-DC converters, eight high performance Idos, two low Rds switches, I<sup>2</sup>C interface, programmable power sequencing and an RTC.

The RK808 improves performance, reduces component count and size, and therefore provides lower cost solution compared to conventional portable designs. The ultra fast 2MHz current mode DC/DC architecture optimizes the transient performance and is compatible with tiny low cost ceramic inductors and capacitors. All DC/DC channels include integrated MOSFETS. Internal soft-start and compensation circuits minimize external components count. Most outputs can be programmed through the I<sup>2</sup>C interface

## 9 STATE MACHINE DESCRIPTION

### 9.1 STATE MACHINE DESCRIPTION

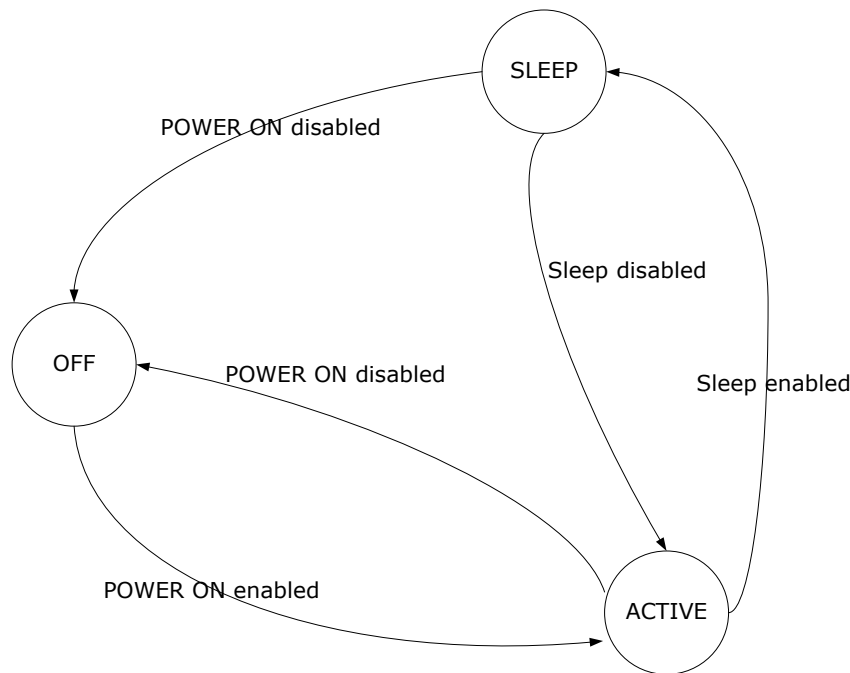

Figure 9-1 State Machine

### 9.2 DEVICE POWER-ON ENABLE CONDITIONS

If none of the device power-on disable conditions is met, the following conditions are available to turn on and/or maintain the ON state of the device:

- PWRON signal low level.
- Or interrupt flag active (INT low) while the device is off (NRESPWRON = 0)  
The power-on enable condition occurs only if the interrupt status bit is initially low (no previous identical interrupt pending in the status register).

The Interrupt sources expected when the device is off are:

- PWRON low-level interrupt (PWRON\_INT = 1 in INT\_STS\_REG1 register)
- First VDC rising above plug-in threshold (PLUG\_IN interrupt(PLUG\_IN\_INT=1 in INT\_STS\_REG2 register) (Charger plug in interrupt)

The Interrupt source expected if enabled when the device is off is:

- RTC Alarm interrupt (INT\_ALARM\_EN=1 in RTC\_INT\_REG and RTC\_ALARM\_INT = 1 in INT\_STS\_REG register)

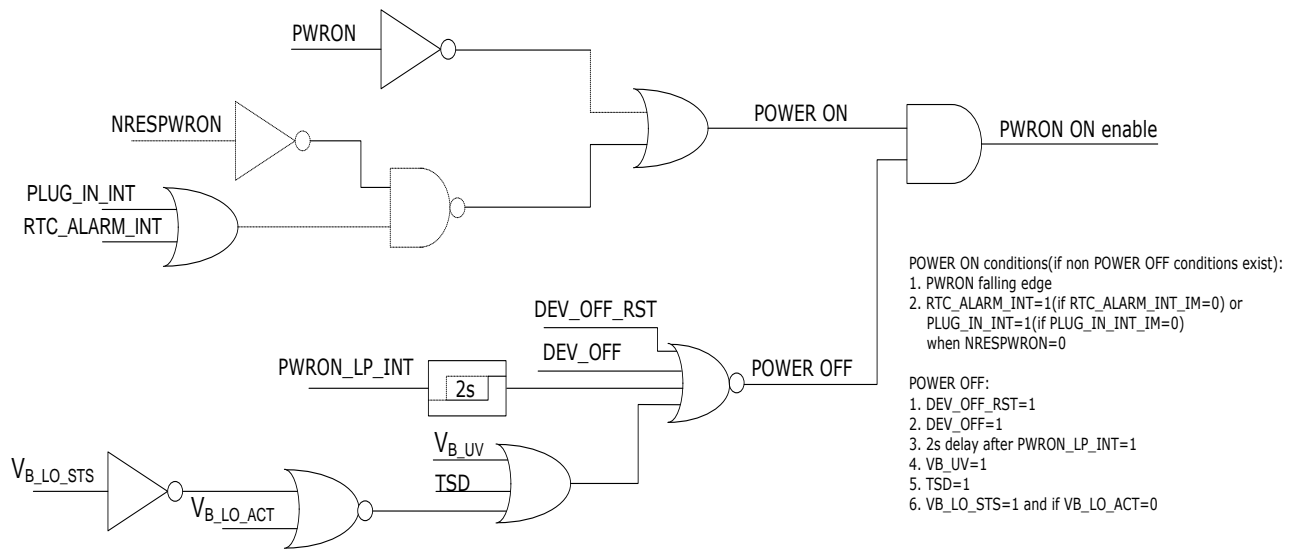

Figure 9-2 Power On Enable Control

### 9.3 DEVICE POWER-ON DISABLE CONDITIONS

- PWRON signal low level during more than the long-press delay:  $T_{DPWRONLP}$ . The interrupt corresponding to this condition is PWRON\_LP\_INT in the INT\_STS\_REG register.
- Or Die temperature has reached the thermal shutdown threshold: TSD\_STS=1 in THERMAL\_REG).
- Or Vbat down below UVLO threshold: VB\_UV\_STS=1 in VB\_MON\_REG.
- Or DEV\_OFF or DEV\_OFF\_RST control bit set to 1 (value of DEV\_OFF is cleared when the device is in OFF state).

### 9.4 DEVICE SLEEP ENABLE CONDITIONS

- SLEEP signal high level.
- OR DEV\_SLP control bit set to 1
- And interrupt flag inactive (INT high): No non-masked interrupt pending

The SLEEP state can be controlled by programming DEV\_SLP and keeping the SLEEP state.

INT=1的条件：下面9种发生任意一种情况都会令INT=1

1. VOUT\_INT=1(if VOUT\_INT\_IM=0)
2. VB\_LO\_INT=1(if VB\_LO\_INT\_IM=0)
3. PWRON\_INT=1(if PWRON\_INT\_IM=0)
4. PWRON\_LP\_INT=1(if PWRON\_LP\_INT\_IM=0)
5. HOTDIE\_INT=1(if HOTDIE\_INT\_IM=0)
6. RTC\_ALARM\_INT=1(if RTC\_ALARM\_INT\_IM=0)
7. RTC\_PERIOD\_INT=1(if RTC\_PERIOD\_INT\_IM=0)
8. PLUG\_IN\_INT=1(if PLUG\_IN\_INT\_IM=0)
9. PLUG\_OUT\_INT=1(if PLUG\_OUT\_INT\_IM=0)
